# TABLE OF CONTENTS

## VOLUME 1

<b>Towards the Guaranteed Control of Production Output: A Probabilistic Approach</b> .....	1
<i>Kirill Chernyshov</i>	
<b>Modelling of HEV Lithium-Ion High Voltage Battery Pack Using Dynamic Data</b> .....	7
<i>Rameshkumar Junnuri, Shivaram Kamat, Nitin Goyal, Ramanathan Annamalai, Dipali Modak, Hiroshi Tashiro, Nobuya Miwa</i>	
<b>On the Set of Perron Exponents of Discrete Linear Systems</b> .....	13
<i>Michal Niezabitowski, Adam Czornik, Jerzy Klamka</i>	
<b>Disturbance Decoupling for Nonlinear Systems by Measurement Feedback: Sensor Location</b> .....	16
<i>Arvo Kaldmae, Ulle Kotta, Alexey Shumsky, Alexey N. Zhirabok</i>	
<b>Experimental Validation of a Novel Control Strategy for an Off-Grid Hybrid Stirling Engine/Supercapacitor Power Generation System</b> .....	22
<i>Mustapha Amine Rahmani, Mazen Alamir, David Gualino, Sylvain Lechat Sanjuan</i>	
<b>Structured Uncertainty Analysis of Pole Placement and <math>H_\infty</math> Controllers for Directional Drilling Attitude Tracking</b> .....	29
<i>Martin Thomas Bayliss, James F. Whidborne, Neilkunal Panchal</i>	
<b>Empirical Models for Utility Disturbances in the Process Industry</b> .....	35
<i>Anna Lindholm, Krister Forsman</i>	
<b>Quantum Lyapunov Control Based on the Average Value of an Imaginary Mechanical Quantity</b> .....	42
<i>Shuang Cong, Fangfang Meng, Sen Kuang</i>	
<b>Stability Analysis of Impulsive Positive Systems</b> .....	49
<i>Ji-Shi Zhang, Yan-Wu Wang, Jiang-Wen Xiao, Zhi-Hong Guan</i>	
<b>Observer-Based Fuzzy Control for Nonlinear Fractional-Order Systems Via Fuzzy T-S Models: The <math>1 &lt; \alpha &lt; 3</math> Case</b> .....	54
<i>Zhe Gao, Xiaozhong Liao</i>	
<b>The Air-Breathing Hypersonic Vehicle Adaptive Backstepping Control Design Based on the Dynamic Surface</b> .....	60
<i>Chengbin Lian, Chen Bai, Zhang Ren, Xingyue Shao</i>	
<b>On Time-Reversibility of Linear Stochastic Models</b> .....	67
<i>Tryphon T. Georgiou, Anders Lindquist</i>	
<b>Exponential Tracking Control of Nonlinear Systems with Actuator Nonlinearity</b> .....	73
<i>Zhengqiang Zhang, Rui-Hua Wang, Hanyong Shao</i>	
<b>A Unified Framework for EIV Identification Methods in the Presence of Mutually Correlated Noises</b> .....	79
<i>Torsten Soderstrom, Roberto Diversi, Umberto Soverini</i>	
<b>Quantized Observer-Based Coordination of Linear Multi-Agent Systems</b> .....	85
<i>Yang Meng, Tao Li</i>	
<b>Self-Organising Disturbance Attenuation in Unidirectionally Coupled Synchronised Systems</b> .....	91
<i>Jan Lunze</i>	
<b>An Iterative Approach to Reduce the Variance of Stochastic Dynamic Systems</b> .....	98
<i>Li Xia</i>	
<b>A Novel Probability Density Estimating Method for Relative Altitudes of Civil Aircraft in Cruising Phase</b> .....	104
<i>Jing-Jie Chen, Yong-Wang Yue</i>	
<b>Generating Initial Estimates for Wiener-Hammerstein Systems Using Phase Coupled Multisines</b> .....	112
<i>Johan Schoukens, Koen Tiels, Maarten Schoukens</i>	
<b>Architecture and Structure of Robust PID Controllers</b> .....	118
<i>Ilan Rusnak, Liat Peled-Eitan</i>	
<b>Modeling of a Power Plant (A Case Study of Savannah Sugar Power Plant)</b> .....	124
<i>Jerome Mishon Gumpy, Jibrin Danladi Jiya</i>	
<b>Model-Plant Mismatch Expression for Classically Controlled Systems</b> .....	131
<i>Laurentz Eugene Olivier, Ian Craig</i>	
<b>Application of Person-By-Person Equilibrium and Performance-Measure Statistics to Distributed Control of Uncertain Stochastic Large-Scale Systems with Time Delays</b> .....	137
<i>Khanh D. Pham</i>	
<b>Residual Generator Fuzzy Identification for Wind Farm Fault Diagnosis</b> .....	145
<i>Silvio Simani, Saverio Farsoni, Paolo Castaldi</i>	
<b>State Dependent Difference Riccati Equation Based Estimation for Corkscrew Maneuver</b> .....	151
<i>Liat Peled-Eitan, Ilan Rusnak</i>	
<b>Model Reference Switching Quasi-LPV Control of a Four Wheeled Omnidirectional Robot</b> .....	157
<i>Damiano Rotondo, Fatiha Nejari, Vicenc Puig</i>	
<b>An Adaptive Controller for Bilateral Teleoperators: Variable Time-Delays Case</b> .....	163
<i>Emmanuel Nuno, Ioannis Sarras, Luis Basanez</i>	
<b>On Adaptive Measurement Inclusion Rate in Real-Time Moving-Horizon Observers</b> .....	169
<i>Mazen Alamir</i>	
<b>Economic Energy Distribution and Consumption in a Microgrid Part 2: Macrocell Level Controller</b> .....	175
<i>Fatemeh Taherstima, Jakob Stoustrup, Palle Andersen, Per Printz Madsen</i>	
<b>Simultaneous Actuation &amp; Sensing for Electrostatic Drives in MEMS Using Frequency Modulated Capacitive Sensing</b> .....	182
<i>Steven Moore, S. O. Reza Moheimani</i>	

<b>Green Building Facilitated by Supply Demand Coordination in Microgrid</b> .....	187
<i>Zhanbo Xu, Qing-Shan Jia, Xiaohong Guan</i>	
<b>Decentralized Detection with Censoring Sensors Over a Packet-Dropping Network</b> .....	194
<i>Xiaoqiang Ren, Ling Shi</i>	
<b>Recursive Actuator Fault Detection and Diagnosis for Emergency Landing of UAS</b> .....	200
<i>Xilin Yang, Luis Mejias Alvarez, Michael David Warren, F. Gonzalez, Ben Upcroft</i>	
<b>Loss Minimization and Voltage Control in Smart Distribution Grid</b> .....	208
<i>Morten Juelsgaard, Christoffer Sloth, Rafal Wisniewski, Jayakrishnan Radhakrishna Pillai</i>	
<b>A Sensorless Speed-Tacking Controller for Permanent Magnet Synchronous Motors with Uncertain Parameters</b> .....	216
<i>Maria Letizia Corradini, Andrea Cristofaro</i>	
<b>FO Sliding Surface for the Robust Control of Integer-Order LTI Plants</b> .....	222
<i>Maria Letizia Corradini, Roberto Giambo, Silvia Pettinari</i>	
<b>A Distributed Cooperative Control Scheme with Optimal Priority Assignment and Stability Assessment</b> .....	228
<i>Haiyang Ding, Mazen Alamir, Ahmad Hably</i>	
<b>Control of VTOL Vehicles with Thrust-Tilting Augmentation</b> .....	234
<i>Minh-Duc Hua, Tarek Hamel, Claude Samson</i>	
<b>Improved Control of Distributed Parameter Systems with Time-Varying Delay Based on Mobile Actuator-Sensor Networks</b> .....	242
<i>Zhengxian Jiang, Baotong Cui, Xiyang Lou</i>	
<b>Collision-Free Vehicle Formation Control Using Graph Laplacian and Edge-Tension Function</b> .....	248
<i>Arshad Mahmood, Yoonsoo Kim</i>	
<b>Robust Static Output-Feedback Control for Uncertain Linear Discrete-Time Systems Via the Generalized KYP Lemma</b> .....	253
<i>Xianwei Li, Shen Yin, Huijun Gao, Okyay Kaynak</i>	
<b>Stabilization of Multi-Dimensional Wave Equation with Boundary Control Matched Disturbance</b> .....	259
<i>Bao-Zhu Guo, Hua-Cheng Zhou, Cui-Zhen Yao</i>	
<b>The Network Operator Method for Identifications of Chemical Reactions</b> .....	265
<i>Askhat Diveev, Elena Sofronova, Irek Gubaidullin</i>	
<b>Wind Turbine Model Validation: Fusion of Simulation and Measurement Data</b> .....	271
<i>Alexander A. Stotsky</i>	
<b>Adaptive Output-Feedback Stabilization of Non-Local Hyperbolic PDEs</b> .....	275
<i>Pauline Bernard, Miroslav Krstic</i>	
<b>Input Selection Using Local Model Network Trees</b> .....	281
<i>Julian Belz, Oliver Nelles</i>	
<b>Real-Time Heave Motion Estimation Using Adaptive Filtering Techniques</b> .....	287
<i>Markus Richter, Klaus Schneider, Dominik Walser, Oliver Sawodny</i>	
<b>Joint Selection Criterion for Optimal Trajectory Planning for Robotic Manipulators Using Dynamic Programming</b> .....	294
<i>Zeeshan Shareef, Ansgar Trachtler</i>	
<b>Performance and Stability for Combined Economic and Regulatory Control in MPC</b> .....	301
<i>Johannes Philippus Maree, Lars Inslund</i>	
<b>Online Reduction of Chattering Alarms in Industrial Operations Due to Random Noises and Oscillations</b> .....	308
<i>Jiandong Wang, Tongwen Chen</i>	
<b>A Distributed Convergent Solution to the Ambulance Positioning Problem on a Streetmap Graph</b> .....	314
<i>Yuquan Wang, Michele Colledanchise, Alejandro Marzinotto, Petter Ogren</i>	
<b>Characteristic Equation for Linear Periodic Systems with Distributed Delay</b> .....	321
<i>Bernhard P. Lampe, Efim N. Rosenwasser, Martin Kurowski</i>	
<b>Controller Design and Region of Attraction Estimation for Nonlinear Dynamical Systems</b> .....	327
<i>Milan Korda, Colin N. Jones, Didier Henrion</i>	
<b>Linear Parameter-Varying Control of Complex Mechanical Systems</b> .....	334
<i>Christian Hoffmann, Herbert Werner</i>	
<b>Frequency-Domain Least-Squares Support Vector Machines to Deal with Correlated Errors When Identifying Linear Time-Varying Systems</b> .....	340
<i>John Lataire, Dario Piga, Roland Toth</i>	
<b>Robust Decentralized PI Control Design</b> .....	346
<i>Petr Husek, Vladimir Kucera</i>	
<b>On Variable Selection of a Nonlinear Non-Parametric System with a Limited Data Set: A Stepwise Algorithm</b> .....	351
<i>Er-Wei Bai, Kang Li, Wenxiao Zhao</i>	
<b>A New Adaptive Algorithm for Periodic Noise Control and Its Stability Analysis</b> .....	357
<i>Yoshikazu Hayakawa, Akira Nakashima, Takayoshi Yasuda, Hiroyuki Ichikawa</i>	
<b>Power Optimal Gate Current Profiles for the Slew Rate Control of Smart Power ICs</b> .....	363
<i>Mathias Blank, Tobias Gluck, Andreas Kugi, Hans-Peter Kreuter</i>	
<b>Output Control of Nonlinear Systems with Unmodelled Dynamics</b> .....	369
<i>Alexey Bobtsov, Sergey Kolyubin, Anton Pyrkin, Aleksandr Kapitonov, Nikolay Nikolaev</i>	
<b>Dual Arm Manipulation Using Constraint Based Programming</b> .....	375
<i>Yuquan Wang, Francisco Eli Vina, Yiannis Karayiannidis, Christian Smith, Petter Ogren</i>	
<b>An Attitude Control System for ZA-AeroSat Subject to Significant Aerodynamic Disturbances</b> .....	384
<i>Willem Herman Steyn, Mike-Alec Kearney</i>	
<b>Optimal Modification of Dynamical Network Topology</b> .....	390
<i>Yoonsoo Kim</i>	

<b>Model Predictive Scheduling for Container Terminals</b> .....	395
<i>Frederik Van Boetelaer, Ton J. J. Van Den Boom, Rudy Negenborn</i>	
<b>A Novel Finite Time Sliding Mode Control for Robotic Manipulators</b> .....	401
<i>Yao Zhao, Yongzhi Sheng, Xiangdong Liu</i>	
<b>Randomized Incremental Least Squares for Distributed Estimation Over Sensor Networks</b> .....	407
<i>Keyou You, Shiji Song, Li Qiu</i>	
<b>Semi-Active Suspension with Semi-Active Inerter and Semi-Active Damper</b> .....	413
<i>Michael Z. Q. Chen, Yinlong Hu, Chanying Li, Guanrong Chen</i>	
<b>A Task and Motion Planning Algorithm for the Dubins Travelling Salesperson Problem</b> .....	419
<i>Pantelis Isaiah, Tal Shima</i>	
<b>H<math>\infty</math> Synthesis Method for Control of Non-Linear Flexible Joint Models</b> .....	425
<i>Patrik Axelsson, Goele Pipeleers, Anders Helmersson, Mikael Norrlof</i>	
<b>H<math>\infty</math> Controller Design Methods Applied to One Joint of a Flexible Industrial Manipulator</b> .....	431
<i>Patrik Axelsson, Anders Helmersson, Mikael Norrlof</i>	
<b>Frequency Domain Maximum Likelihood Identification of Noisy Input-Output Models</b> .....	438
<i>Umberto Soverini, Torsten Soderstrom</i>	
<b>A Magnetic Levitation System for Advanced Control Education</b> .....	444
<i>Wen Yu, Xiaou Li</i>	
<b>Stable PID Vibration Control of Building Structures</b> .....	450
<i>Wen Yu, Thenozhi Suresh, Xiaou Li</i>	
<b>Optimal Sampled-Data State Feedback Control of Linear Systems</b> .....	456
<i>Matheus Souza, Gabriela Werner Gabriel Vital, Jose C. Geromel</i>	
<b>Novel Anti-Windup PID Controller Design under Holonomic Endpoint Constraints for Euler Lagrange Systems with Actuator Saturation</b> .....	462
<i>Mitsuru Kanamori, Keigo Iwagami</i>	
<b>Frequency Domain Causality Analysis Method for Multivariate Systems in Hypothesis Testing Framework</b> .....	468
<i>Jing Zhang, Dong Han, Fan Yang, Hao Ye, Maoyin Chen</i>	
<b>Backstepping Experimentally Applied to an Antagonistically Driven Finger with Flexible Tendons</b> .....	476
<i>Maxime Chalon, Brigitte D'Andrea-Novel</i>	
<b>Retrofitting a Passive Vibration Isolation System with Zero-Compliance Modules</b> .....	483
<i>Takeshi Mizuno, Yuji Ishino, Masaya Takasaki</i>	
<b>Optimization Based Tuning of Fault Detection and Diagnosis Systems for Safety Critical Systems</b> .....	489
<i>Daniel Ossmann</i>	
<b>Enhancement of Dual-Rate Estimation and Its Application Demonstration</b> .....	495
<i>Binh Minh Nguyen, Hiroshi Fujimoto, Yoichi Hori</i>	
<b>Model Matching Problems for Switching Linear Systems</b> .....	501
<i>Giuseppe Conte, Anna Maria Perdon, Elena Zattoni</i>	
<b>LPV Torque Vectoring for an Electric Vehicle with Experimental Validation</b> .....	507
<i>Gerd Kaiser, Matthias Korte, Qin Liu, Christian Hoffmann, Herbert Werner</i>	
<b>Cascaded Loops Control of DC Motor Driven Joint Including an Acceleration Loop</b> .....	513
<i>Pierre-Philippe Robet, Maxime Gautier</i>	
<b>Three-Dimensional Nonlinear Path-Following Guidance Law Based on Differential Geometry</b> .....	519
<i>Namhoon Cho, Youdan Kim, Sanghyuk Park</i>	
<b>Adaptive H<math>\infty</math> Consensus Control of Multi-Agent Systems by Utilizing Neural Network Approximators</b> .....	525
<i>Yoshihiko Miyasato</i>	
<b>Adaptive Inverse Output Feedback Control of Uncertain Systems Preceded with Hysteresis Actuators</b> .....	531
<i>Sining Liu, Chun-Yi Su</i>	
<b>Non-switching Reaching Law Based Discrete Time Quasi-sliding Mode Control with Application to Warehouse Management Problem</b> .....	537
<i>Piotr Lesniewski, Andrzej Bartoszewicz</i>	
<b>Observability and Estimation Methods Using Synchrophasor</b> .....	543
<i>Wei Kang, Kai Sun</i>	
<b>Global Finite-Time Stabilization for Stochastic Nonlinear Systems Via Output-Feedback</b> .....	549
<i>Wenting Zha, Junyong Zhai, Shumin Fei</i>	
<b>A Microgrid Library in a General Simulation Language</b> .....	555
<i>Johanna Salazar, Fernando Tadeo, Cesar De Prada</i>	
<b>Strategic Zero Placement for Integral Resonant Control to Improve the Positioning Bandwidth of Nanopositioners</b> .....	561
<i>Douglas Russell, Andrew John Fleming, Sumeet Aphale</i>	
<b>Energy-Efficient Trajectory Planning for a Mobile Agent by Using a Two-Stage Decomposition Approach</b> .....	567
<i>Han Yu, Yebin Wang, Scott Bortoff, Koichiro Ueda</i>	
<b>Functional Series Expansions for Nonlinear Input-Output Systems with Delay</b> .....	573
<i>W. Steven Gray, Makhin Thitsa, Erik I. Verriest</i>	
<b>Model Predictive Regulation</b> .....	579
<i>Cesar Aguilar, Arthur J Krener</i>	
<b>Enabling Predictive Maintenance Using Semi-Supervised Learning with Reg-D Transformer Data</b> .....	587
<i>Jaco Du Toit</i>	
<b>Real-Time Model Predictive Control for Quadrotors</b> .....	593
<i>Moses Bangura, Robert Mahony</i>	
<b>A LASSO-Based Batch Process Modeling and End-Product Quality Prediction Method</b> .....	601
<i>Zhengbing Yan, Chih-Chiun Chiu, Weiwei Dong, Yuan Yao</i>	

<b>Attitude Synchronization for Multiple Flexible Spacecraft Based on Non-Smooth Control</b> .....	607
<i>Haibo Du, Yigang He, Shihua Li, Yingying Cheng, Xisong Chen</i>	
<b>End of Life Management of Automation and IT Devices</b> .....	612
<i>Peter Kopacek, Bernd Kopacek</i>	
<b>Adaptive PD Power-Level Control for Pressurized Water Reactors</b> .....	618
<i>Zhe Dong</i>	
<b>Decentralized Networked Control for Vehicle-String Velocity and Spacing Distance Bias System</b> .....	624
<i>Lianzeng Ma, Xue-Bo Chen, Huaguang Zhang</i>	
<b>Performance and Safety of STAR Glycaemic Control in Neonatal Intensive Care: Further Clinical Results Including Pilot Results from a New Protocol Implementation</b> .....	630
<i>Jennifer Launa Dickson, Adrienne Lynn, Cameron Allan Gunn, Aaron Le Compte, Liam Fisk, Geoffrey M Shaw, J. Geoffrey Chase</i>	
<b>Analytical Optimal Solutions of Impulsive Out-Of-Plane Rendezvous Around Elliptic Orbits</b> .....	636
<i>Romain Serra, Denis Arzelier, Aude Rondepierre, Jean-Louis Calvet</i>	
<b>Gender and Glycaemia: Insulin Sensitivity and Secretion in Premature Neonates</b> .....	642
<i>Jennifer Launa Dickson, J. Geoffrey Chase, Cameron Allan Gunn, Christopher Pretty, Adrienne Lynn, Jane Alswailer</i>	
<b>An Attitude Control System for the Deployment and Stabilisation of a Tethered Dual CubeSat Mission</b> .....	648
<i>Mike-Alec Kearney, Willem Herman Steyn</i>	
<b>Disturbance Decoupling by Measurement Feedback</b> .....	654
<i>Arvo Kaldmae, Ulle Kotta</i>	
<b>Architectural Issues in the Control of Tall Multiple-Input Multiple-Output Plants</b> .....	660
<i>Pedro Albertos, Mario E. Salgado</i>	
<b>LMI Results for Robust Control Design of Observer-based Controllers, the Discrete-time Case with Polytopic Uncertainties</b> .....	665
<i>Dimitri Peaucelle, Yoshio Ebihara</i>	
<b>An Analytical Solution to Operational Space Control of Robotic Manipulators with Kinematic Constraints</b> .....	671
<i>Cong Dung Pham, Fernando Coutinho, Fernando Lizarralde, Liu Hsu, Pal Johan From</i>	
<b>Frequency Domain EIV Identification: A Frisch Scheme Approach</b> .....	678
<i>Umberto Soverini, Torsten Soderstrom</i>	
<b>Simple Tracking Output Feedback <math>H_\infty</math> Control for Switched Linear Systems: Lateral Vehicle Control Application</b> .....	684
<i>Lghani Menhour, D. Koenig, Brigitte D'Andrea-Novel</i>	
<b>Robotic Competitions: Teaching Robotics and Real-Time Programming with LEGO Mindstorms</b> .....	690
<i>Raffaele Grandi, Riccardo Falconi, Claudio Melchiorri</i>	
<b>Individual Driver Modeling Via Optimal Selection of Steering Primitives</b> .....	696
<i>Michael Flad, Clemens Trautmann, Gunter Diehm, Soeren Hohmann</i>	
<b>Optimal Sensor and Actuator Placement in Complex Dynamical Networks</b> .....	703
<i>Tyler Summers, John Lygeros</i>	
<b>Adaptive <math>H_\infty</math> Consensus Control for Distributed Parameter Systems of Parabolic Type</b> .....	709
<i>Yoshihiko Miyasato</i>	
<b>Real-Time Breath-To-Breath Asynchrony Event Detection Using Time-Varying Respiratory Elastance Model</b> .....	715
<i>Sarah F Poole, Yeong Shiong Chiew, Daniel Paul Redmond, Shaun M Davidson, Nor Salwa Damanhuri, Christopher Pretty, Paul D Docherty, Thomas Desaive, Geoffrey M Shaw, J. Geoffrey Chase</i>	
<b>Fostering Automatic Control Students to Become Innovators</b> .....	721
<i>Charlotta Johnsson, Qinmin Yang, Carl-Henric Nilsson, Jun Jin, Anders Warell, Andreas Larsson</i>	
<b>Energy Based Set Point Modulation for Obstacle Avoidance in Haptic Teleoperation of Aerial Robots</b> .....	727
<i>Xiaolei Hou, Changbin Yu, Feng Liang, Zhiyun Lin</i>	
<b>Periodic Modes and Bistability in an Impulsive Goodwin Oscillator with Large Delay</b> .....	733
<i>Alexander Churilov, Alexander Medvedev, Zhanybai Zhusubaliyev</i>	
<b>Lyapunov-Based Pursuit Guidance Law with Impact Angle Constraint</b> .....	739
<i>Mingu Kim, Youdan Kim</i>	
<b>A Positive Observer for Linear Systems</b> .....	745
<i>Filippo Cacace, Alfredo Germani, Costanzo Manes</i>	
<b>Comparative Study of Two Global Affine Linear Periodic Parameter Varying State Space Model Estimation Algorithms</b> .....	751
<i>Jan Goos, Rik Pintelon</i>	
<b>An Underwater Vehicles Dynamics in the Presence of Noise and Fokker-Planck Equations</b> .....	757
<i>Shambhu N. Sharma, Ravish H. Hirpara</i>	
<b>Implementation of the Sliding Mode Control with Constant and Varying Sliding Surfaces to a Hydraulically-Actuated Fin Loading System</b> .....	764
<i>Mehmet Ugur Ozakahn, Metin U. Salamci, Bulent Ozkan</i>	
<b>Robust Tracking Control of 6-DOF Parallel Electrical Manipulator in Joint-Task Space with Fast Friction Estimation</b> .....	770
<i>Renjian Hao, Junzheng Wang, Jiangbo Zhao, Shoukun Wang</i>	
<b>A Convexity Result for the Optimal Control of a Class of Positive Nonlinear Systems</b> .....	776
<i>Franco Blanchini, Patrizio Colaneri, Richard Middleton</i>	
<b>Adaptive Observer for Switching Linear Parameter-Varying (LPV) Systems</b> .....	782
<i>Damiano Rotondo, Vasso Reppa, Vicenc Puig, Fatiha Nejjar</i>	
<b>Switched Linear Systems Control Design: A Transfer Function Approach</b> .....	788
<i>Grace S. Deaecto, Jose C. Geromel</i>	
<b>Robust Model-Based Soft Sensor: Design and Application</b> .....	794
<i>Rajamani Doraiswami, Lahouari Cheded</i>	

<b>Time-Varying Respiratory Elastance for Spontaneously Breathing Patients</b> .....	800
<i>Yeong Shiong Chiew, Sarah F Poole, Daniel Paul Redmond, Erwin J. Van Druenen, Nor Salwa Damanhuri, Christopher Pretty, Paul D Docherty, Bernard Lambermont, Geoffrey M Shaw, Thomas Desaive, J. Geoffrey Chase</i>	
<b>Comparison of Periodic and Event Based Sampling for Linear State Estimation</b> .....	806
<i>Bing-Chang Wang, Minyue Fu</i>	
<b>Data-Based Characteristics Analysis for Linear Discrete-Time Systems</b> .....	812
<i>Zhuo Wang, Derong Liu</i>	
<b>An Application of Multi-Parametric Programming in Integrated Circuit Automation (Slotting Problem)</b> .....	818
<i>Juraj Stevek, Michal Kvasnica, Miroslav Fikar, Andrej Vrbcicky</i>	
<b>Joint Design of PI Controller and Scheduler for Embedded Control Systems</b> .....	824
<i>Sven Reimann, Wei Wu, Steven Liu</i>	
<b>Linking Regularization and Low-Rank Approximation for Impulse Response Modeling</b> .....	830
<i>Anna Marconato, Lennart Ljung, Yves Rolain, Johan Schoukens</i>	
<b>Event-Triggered Control for Linear Systems Subject to Actuator Saturation</b> .....	836
<i>Wei Wu, Sven Reimann, Steven Liu</i>	
<b>Intra-Batch Evolution Based Process Monitoring for Multiphase Batch Processes</b> .....	842
<i>Luping Zhao, Chunhui Zhao, Furong Gao</i>	
<b>Airborne Wind Energy: Airfoil-Airmass Interaction</b> .....	848
<i>Mario Zanon, Sebastien Gros, Johan Meyers, Moritz Diehl</i>	
<b>Neural Network Evaluation of Combustion Process for Continuous Control of Small Scale Biomass Fired Boilers</b> .....	854
<i>Stanislav Vrājna, Viktor Placek, Cyril Oswald, Bohumil Sulc, Petr V Neuman</i>	
<b>Quantized Feedback Stabilization of Sampled-Data Switched Linear Systems</b> .....	860
<i>Masashi Wakaiki, Yutaka Yamamoto</i>	
<b>Sliding Mode Versus Parallel Compensator Based Control under Measurement Noise</b> .....	866
<i>Ryszard Gessing</i>	

## VOLUME 2

<b>Optimal Design of Remote Controllers for LTI Plants Over Erasure Channels</b> .....	872
<i>Eduardo I. Silva, Alejandro I. Maass, Francisco J. Vargas</i>	
<b>Nearly Optimal Control Scheme for Discrete-Time Nonlinear Systems with Finite Approximation Errors Using Generalized Value Iteration Algorithm</b> .....	878
<i>Qinglai Wei, Derong Liu</i>	
<b>Opportunities and Good Practice in Control Education: A Survey</b> .....	884
<i>J. Anthony Rossiter, Bryn Li. Jones, Richard M. Murray, Ljubo Vlacic, Sebastian Dormido</i>	
<b>Accelerometer-Based Online Reconstruction of Vibrations in Extremely Large Telescopes</b> .....	890
<i>Alexander Keck, Jorg-Uwe Pott, Oliver Sawodny</i>	
<b>Arcminute Attitude Estimation for CubeSats with a Novel Nano Star Tracker</b> .....	897
<i>Alex Erlank, Willem Herman Steyn</i>	
<b>Aggregation and Control of Supermarket Refrigeration Systems in a Smart Grid</b> .....	903
<i>Rasmus Pedersen, John Schwensen, Benjamin Biegel, Jakob Stoustrup, Torben Green</i>	
<b>Lyapunov-Based Control of the Sway Dynamics for Elevator Ropes with Time-Varying Lengths</b> .....	911
<i>Mouhacine Benosman</i>	
<b>Control Energy Consumption and System Performance in Vector Control of Voltage Source Converters</b> .....	917
<i>Xiaodong Zhao, Kang Li</i>	
<b>Stabilization of Time-Delay Markovian Jump Systems Via Probability Rate Synthesis and State Feedback</b> .....	923
<i>Shan Ma, Junlin Xiong</i>	
<b>Second-order Particle MCMC for Bayesian Parameter Inference</b> .....	929
<i>Johan Dahlin, Fredrik Lindsten, Thomas Bo Schon</i>	
<b>Particle Filter-Based Gaussian Process Optimisation for Parameter Inference</b> .....	935
<i>Johan Dahlin, Fredrik Lindsten</i>	
<b>Model Matching Via Stabilizing Static State Feedback</b> .....	941
<i>Eduardo Castaneda, Vladimir Kucera, Javier Ruiz-Leon</i>	
<b>Robust Stability Analysis of Discrete-time Systems with Parametric and Switching Uncertainties</b> .....	947
<i>Dimitri Peaucelle, Yoshio Ebihara</i>	
<b>Feed-Forward Control of a Vehicle with Single-Wheel Actuators</b> .....	953
<i>Jan-Erik Moseberg, Gunter Roppenecker</i>	
<b>A Comparative Study of Water Wall Model Using a Linear Model and a Neural Network Model</b> .....	959
<i>Un-Chul Moon, Jaewoo Lim, Goen Go, Kwang Y. Lee</i>	
<b>An Adaptive Driver Model for Driving Cycle Prediction in the Intelligent Truck</b> .....	965
<i>Frank Alexander Bender, Hakan Uzuner, Oliver Sawodny</i>	
<b>Fuel Efficiency Analysis for Simultaneous Optimization of the Velocity Trajectory and the Energy Management in Hybrid Electric Vehicles</b> .....	971
<i>Gunter Heppeler, Marcus Sonntag, Oliver Sawodny</i>	
<b>Response Time Driven Design of Control Systems</b> .....	977
<i>Yang Xu, Karl-Erik Arzen, Enrico Bini, Anton Cervin</i>	
<b>Determining the Long-Term Behavior of Cell Populations: A New Procedure for Detecting Ergodicity in Large Stochastic Reaction Networks</b> .....	984
<i>Ankit Gupta, Mustafa H. Khammash</i>	

<b>Parameter Set Selection for Signal Transduction Pathway Models Including Uncertainties</b> .....	990
<i>Wei Dai, Loveleena Bansal, Juergen Hahn</i>	
<b>A Pilot Study of Continuous Glucose Monitoring in Critically Ill Patients: Do They Perform Well Enough for Use in Glycaemic Control?</b> .....	996
<i>Matthew Signal, Liam Fisk, Geoffrey M Shaw, J. Geoffrey Chase</i>	
<b>Improved Dual Decomposition for Distributed Model Predictive Control</b> .....	1002
<i>Pontus Giselsson</i>	
<b>Improved Fast Dual Gradient Methods for Embedded Model Predictive Control</b> .....	1009
<i>Pontus Giselsson</i>	
<b>Improved Integral Force Feedback and Structured PI Tracking Control: Application for High Speed Confocal Microscopy</b> .....	1016
<i>Yik Ren Teo, Douglas Russell, Sumeet Aphale, Andrew John Fleming</i>	
<b>Nonlinear State Feedback Ho-Control of Mechanical Systems Under Unilateral Constraints</b> .....	1023
<i>Oscar Eduardo Montano, Yury Orlov, Yamick Aoustin</i>	
<b>Dynamic Modeling and Image-Based Adaptive Visual Servoing of Cable-Driven Soft Robotic Manipulator</b> .....	1029
<i>Hesheng Wang, Weidong Chen, Xiaozhou Wang, Rolf Pfeifer</i>	
<b>A Modified Polynomial-Based Controller for Enhancing the Positioning Bandwidth of Nanopositioners</b> .....	1035
<i>Mohammad Namavar, Sumeet Aphale</i>	
<b>Road Slope Estimation in Bicycles without Torque Measurements</b> .....	1041
<i>Matteo Corno, Pierfrancesco Spagnol, Sergio Savaresi</i>	
<b>Frequency Identification of Hammerstein-Wiener Systems with Piecewise Affine Input Nonlinearity</b> .....	1047
<i>Adil Brouiri, Fouad Giri, Fatima-Zahra Chaoui, Aomar Amdouri</i>	
<b>Cyclist Heart Rate Control Via a Continuously Varying Transmission</b> .....	1053
<i>Paolo Giani, Matteo Corno, Mara Tanelli, Sergio Savaresi</i>	
<b>Solution of the Static Reduced Decoupling Problem for Linear Systems</b> .....	1059
<i>Jean-Francois Lafay</i>	
<b>Control Over Additive White Gaussian Noise Channels: Bode-Type Integrals, Channel Blurredness, Negentropy Rate, and Beyond</b> .....	1065
<i>Song Fang, Hideaki Ishii, Jie Chen</i>	
<b>Discrete-Time Linear Quadratic Optimal Control with Fixed and Free Terminal State Via Double Generating Functions</b> .....	1071
<i>Dijian Chen, Zhiwei Hao, Kenji Fujimoto, Tatsuya Suzuki</i>	
<b>A New Filtering Approach for Continuous-Time Linear Systems with Delayed Measurements</b> .....	1077
<i>Filippo Cacace, Francesco Conte, Alfredo Germani</i>	
<b>A Nonlinear Controller for Parallel Induction Heating Systems</b> .....	1083
<i>Jonathan Zerad, Samer Riachy, Pierre Toussaint, Jean Pierre Barbot</i>	
<b>Fragility in Networks: Application to the Epileptic Brain</b> .....	1089
<i>Duluxan Sriharan, Sridevi Sarma</i>	
<b>Semi-Active Wide-Area Fault-Tolerant Control in Electric Power Systems</b> .....	1095
<i>Felix Rafael Segundo Sevilla, Petr Korba</i>	
<b>Car Attitude Control by Series Mechatronic Suspension</b> .....	1101
<i>Carlos Arana, Simos Evangelou, Daniele Dini</i>	
<b>A Clutch Based Transmission for Mechanical Flywheel Applications</b> .....	1107
<i>Martin Steinberger, Martin Horn, Christian Milwisch, Walter Rosinger</i>	
<b>Model Reference Adaptive Control of Glucose in Type 1 Diabetics: A Simulation Study</b> .....	1113
<i>Marian Tarnik, Eva Miklovicova, Jan Murgas, Ivan Ottinger, Tomas Ludwig</i>	
<b>Trajectory Tracking of Batch Product Quality Using Latent Variable Models</b> .....	1119
<i>Eduardo Benedicto Lopez-Montero, Ognjen Marjanovic, Barry Lennox</i>	
<b>Fault Tolerant Spacecraft Attitude Control by Multiple Control Processors</b> .....	1125
<i>Hao Yang, Bin Jiang, Vincent Cocquempot</i>	
<b>Filtering and Identification of Stochastic Risk Premium for Electricity Spot Price Models</b> .....	1131
<i>Shin Ichi Aihara, Arunabha Bagchi, Emad Imreizeeq</i>	
<b>Adaptive Fault-Tolerant Control for Time-Delay Nonlinear Systems with Stochastic Actuator Failures</b> .....	1137
<i>Bing Liu, Huijin Fan</i>

---

**Abstract:** When the state dimension is large, classical approximate dynamic programming techniques may become computationally unfeasible, since the complexity of the algorithm grows exponentially with the state space size (curse of dimensionality). Policy search techniques are able to overcome this problem because, instead of estimating the value function over the entire state space, they search for the optimal control policy in a restricted parameterized policy space. This paper presents a new policy parametrization that exploits a single point (particle) to represent an entire region of the state space and can be tuned through a recently introduced policy gradient method with parameter-based exploration. Experiments demonstrate the superior performance of the proposed approach in high dimensional environments.

*Keywords:* Markov decision processes, Stochastic optimal control, Approximate dynamic programming, Reinforcement learning, Policy search.

## 1. INTRODUCTION

Stochastic optimal control problems arise in several application contexts such as communication networks, manufacturing systems, air traffic management, and power networks. Such problems are particularly challenging due to the stochastic hybrid dynamics of the system, which involves a tight coupling of continuous dynamics, discrete dynamics, and uncertainty. In particular, the computational complexity of the problem increases rapidly with the system size, motivating the quest for efficient algorithms. In this paper, we investigate the problem of designing an optimal control policy for large scale stochastic systems and determining an approximate solution through a scalable computational procedure. We consider systems that can be modeled as discrete time Markov Decision Processes (MDPs) (Puterman, 1994) with a continuous state space component, and focus on the case where the control space is discrete. The assumption of dealing with MDPs is not restrictive, since they include quite general classes of systems such as discrete time stochastic hybrid systems (Abate et al., 2008).

An MDP is a probabilistic dynamic model where the state evolution is governed by transition probabilities that depend on the control input. If the objective is to maximize some additive reward function along a future time horizon, the optimal control policy that maps each state into the appropriate control action can be characterized through the Dynamic Programming (DP) approach. The rationale of the DP control design methodology is to take into account the immediate impact of the decisions taken at each stage (through some instantaneous reward) as well

as their expected future impact over the residual look-ahead time horizon. The maximum expected return that can be obtained starting from any given state is expressed by the optimal value function. If the horizon is infinite and the rewards are discounted, the optimal value function can be characterized as a fixed point of the Bellman optimality equation (Sutton and Barto, 1998). For any MDP, there always exists at least one optimal policy that is a *deterministic*, *i.e.*, where the state-control input map is deterministic.

Unfortunately, the fixed point of the Bellman equation cannot be determined analytically, neither can it be finitely represented, due to the continuous component of the state of the system, and computing the policy calls for some Approximate Dynamic Programming (ADP) method (Sutton and Barto, 1998; Powell, 2007; Busoniu et al., 2010). ADP methods typically consist in an iterative scheme for successively improving the quality of the approximation of the optimal value function (value iteration methods) or of the optimal control policy itself (policy search methods). Parametric approximate representations of the value function or of the control policy are typically introduced to solve the well-known curse of dimensionality afflicting DP. In particular, Reinforcement Learning (RL) approaches (Sutton and Barto, 1998) approximate the expected values involved in the value function computation and policy evaluation using empirical averages over data obtained through the direct interaction between the learning algorithm and the system to be controlled. Such approaches allow to learn optimal or near-optimal policies, even when the system dynamics are unknown or in high dimensional problems.

Policy search methods are among the most effective learning algorithms for dynamical stochastic tasks with con-

tinuous state and action spaces, and they have been successfully applied to several real tasks (Peters et al., 2003). These methods exploit optimization techniques to search for an optimal policy that maximizes the expected return over some parameterized policy space. In particular, policy gradient methods perform at each iteration a local search in the policy space guided by the gradient of the expected return, that can be estimated from the system trajectories. Unfortunately, standard gradient-based methods, such as REINFORCE or G(PO)MDP (Peters and Schaal, 2008), need to search in the space of stochastic policies, thus suffering from high variance in the gradient estimates, which in turn leads to slow convergence rates.

Recently, a parameter-based exploration strategy (Sehnke et al., 2010) named policy gradient with parameter-based exploration (PGPE) has been presented, that allows to consider *deterministic* policies and introduces a probability distribution over the policy parametrization instead. Then, it searches for the optimal deterministic policy by updating the parameters of such a distribution (denoted hyperparameters) following the estimated gradient direction. In this way, the search in the policy space is replaced by a direct search in the hyperparameter space. As all classical policy gradient approaches, the PGPE estimates the gradient via simulation of system trajectories. However, by moving the stochasticity from the policy to the hyperparameters distribution, it produces low variance trajectories that yield low variance gradient estimates (Zhao et al., 2012). An additional feature of the PGPE is that – differently from standard policy-gradient approaches – it allows the use of policies that are non-differentiable in their parametrization, since the gradient of the expected performance is estimated with respect to the hyperparameters.

In this paper, we propose a novel parametrization of the policy that maps the continuous state space of an MDP onto its finite control space. More precisely, the state feedback policy is represented through particles positioned over the state space and labeled with different control actions. A set of particles defines a policy by partitioning the state space through the associated Voronoi diagram, so that in each state the policy chooses the action associated to the closest particle. Each particle is positioned randomly based on a multivariate Gaussian density function, and a categorical distribution is used to extract the action associated to it. The mean vector and covariance matrix of the Gaussian density function, together with the parameters of the categorical distribution, constitute the hyperparameters to be tuned.

## 2. PRELIMINARIES

In this section we briefly recall the concept of discrete-time MDP. An MDP is a tuple  $\langle X, U, f, r, \gamma, D \rangle$ , where  $X$  is the state space,  $U$  is the action space,  $f : X \times X \times U \rightarrow \mathbb{R}_+$  is the Markovian transition model where  $f(x'|x, u)$  denotes the transition density between state  $x$  and state  $x'$  under  $u$ ,  $r : X \times U \times X \rightarrow \mathbb{R}$  is the reward function, such that  $r(x, u, x')$  is the instantaneous reward obtained starting from state  $x$  taking action  $u$  and reaching state  $x'$ ,  $\gamma \in [0, 1)$  is a discount factor, and  $D$  is the distribution of the initial state.

A stochastic policy is defined by a probability density function  $\pi(\cdot|x)$  over the action space  $U$ , which represents

the probability of taking action  $u$  in state  $x$ . When the policy is deterministic, the probability density function becomes a probability mass function concentrated in a single action for each state value. In that case, with a slight abuse of notation, we use  $\pi$  to denote the map between states and actions, *i.e.*,  $\pi : X \rightarrow U$ . We consider infinite horizon problems where the future rewards are exponentially discounted with  $\gamma$ . The value of state  $x$  under policy  $\pi$  is expressed as the expected return when starting in  $x$  and following  $\pi$  thereafter<sup>1</sup>:

$$V^\pi(x) = \mathbb{E}_{\substack{u(k) \sim \pi \\ x(k) \sim f}} \left[ \sum_{k=0}^{\infty} \gamma^k r(x(k), u(k), x(k+1)) | x(0) = x \right].$$

Given the initial state distribution  $D$ , the policy performance can be evaluated through its expected discounted return:

$$J_D^\pi = \int_X D(x) V^\pi(x) dx.$$

Solving an MDP implies finding a policy  $\pi^*$  that maximizes the expected reward:  $\pi^* \in \arg \max_{\pi \in \Pi} J_D^\pi$ , where  $\Pi$  is the set of all (stochastic and deterministic) policies. Interestingly, for any MDP there exists at least one deterministic optimal policy that maximizes  $V^\pi(x)$ , for all  $x \in X$  (Puterman, 1994).

In the following, we consider the problem of finding a policy that maximizes the expected discounted reward over a class of parameterized policies  $\Pi_\theta = \{\pi_\theta : \theta \in \mathbb{R}^d\}$ , where  $\pi_\theta$  is a compact notation for  $\pi(u|x, \theta)$ . For ease of notation, we will denote with  $J(\theta)$  the expected discounted reward of policy  $\pi_\theta$ . In particular, we focus on MDPs with continuous state space  $X \subseteq \mathbb{R}^n$  and discrete action space  $U$ , with  $|U| = m$ .

## 3. THE PGPE ALGORITHM

In this section we describe the policy gradient approach. To this aim we need first to introduce some further notation. Let  $h = [x_0, u_0, \dots, x_T]$  denote a sequence of values for states and actions of finite length  $T$  (called history). Given a history  $h$ , we define the discounted cumulative reward along  $h$  as:

$$r(h) = \sum_{k=0}^{T-1} \gamma^k r(x_k, u_k, x_{k+1}).$$

Then,  $J(\theta)$  can be approximated as follows

$$J(\theta) \approx \int_H \mathbb{P}(h|\theta) r(h) dh,$$

where  $H$  is the set of all histories  $h$ , and

$$\mathbb{P}(h|\theta) = D(x_0) \prod_{k=0}^{T-1} f(x_{k+1}|x_k, u_k) \pi(u_k|x_k, \theta).$$

Policy gradient approaches update the policy following the direction of the gradient of the expected discounted reward w.r.t. the policy parameters:

$$\nabla_\theta J(\theta) \approx \int_H \mathbb{P}(h|\theta) \sum_{k=0}^{T-1} \nabla_\theta \log \pi_\theta(u_k|x_k) r(h) dh.$$

Since integrating over all the possible histories is practically unfeasible, the previous gradient can only be esti-

<sup>1</sup> The time dependence of stochastic variables is indicated in brackets, *e.g.*,  $x(k)$ , whereas  $x_k$  denotes a possible extracted value of  $x(k)$ .

mated, *e.g.*, by means of Monte Carlo simulations as in the REINFORCE algorithm (Williams, 1992):

$$\nabla_{\theta} J(\theta) \approx \frac{1}{N} \sum_{n=1}^N \sum_{k=0}^{T-1} \nabla_{\theta} \log \pi_{\theta}(u_k^{(n)} | x_k^{(n)}) r(h^{(n)}),$$

where the histories  $h^{(i)}$  are extracted at random according to  $\mathbb{P}(h^{(i)} | \theta)$ . The Monte Carlo estimate of the gradient suffers from high variance (Peters and Schaal, 2008) due to the stochasticity introduced at every transition step by the stochastic policy, which involves sampling the action at every step and, hence, produces several different histories. The PGPE algorithm (Sehnke et al., 2010) is able to reduce the variance problem by replacing the stochastic policy with multiple deterministic policies whose parameters  $\theta$  are drawn from a probability distribution  $\mathbb{P}(\theta | \rho)$  that is a function of a hyperparameter vector  $\rho$ . PGPE updates  $\rho$  following a gradient ascent approach, in order to increase the probability of drawing deterministic policies with higher expected returns. Its main advantage comes from the low variance of the expected returns of histories produced by deterministic policies: the stochasticity is moved to a higher level with the goal of guiding the exploration of the policy parameters  $\theta$ . Indeed, Zhao et al. (2012) have shown that the gradient estimate in the PGPE has a lower variance than in REINFORCE. Another advantage of the PGPE is that no assumption on the differentiability of the policy w.r.t. to the parameters  $\theta$  is required.

The performance measure in the PGPE is the expected value of  $J(\theta)$  with respect to the distribution  $\mathbb{P}(\cdot | \rho)$ :

$$J(\rho) = \mathbb{E}_{\theta \sim \mathbb{P}(\cdot | \rho)} [J(\theta)].$$

The goal is to find the best parametrization, *i.e.*, the hyperparameters  $\rho^* \in \arg \max_{\rho \in P} J(\rho)$ . According to the gradient-based optimization:

$$J(\rho) \approx \int_{\Theta} \int_H \mathbb{P}(h | \theta) \mathbb{P}(\theta | \rho) r(h) dh d\theta,$$

and the hyperparameters  $\rho$  are updated following the gradient direction:

$$\rho_{i+1} = \rho_i + \beta_i \nabla_{\rho} J(\rho_i),$$

where, using the equivalence ( $\mathbb{P}(\theta | \rho) \nabla_{\rho} \log \mathbb{P}(\theta | \rho) = \nabla_{\rho} \mathbb{P}(\theta | \rho)$ ), we can write:

$$\nabla_{\rho} J(\rho) = \int_{\Theta} \mathbb{P}(\theta | \rho) \nabla_{\rho} \log \mathbb{P}(\theta | \rho) \int_H \mathbb{P}(h | \theta) r(h) dh d\theta,$$

The previous equation cannot be solved directly because the integration over the entire space of histories and policy parameters is unfeasible. However, a sampling method can be exploited for the gradient estimation:

$$\nabla_{\rho} J(\rho) \approx \frac{1}{N} \sum_{n=1}^N r(h^{(n)}) \nabla_{\rho} \log \mathbb{P}(\theta^{(n)} | \rho).$$

where the pairs  $(\theta^{(n)}, h^{(n)})$  are extracted independently according to the following mechanism: parameter  $\theta^{(n)}$  is drawn first from  $\mathbb{P}(\cdot | \rho)$  and then history  $h^{(n)}$  is drawn from the conditional distribution  $\mathbb{P}(\cdot | \theta^{(n)})$ . As a consequence, the PGPE implementation requires to generate at every iteration a dataset  $\mathcal{D} = \{\theta^{(n)}, h^{(n)}\}_{n=1}^N$ .

To further reduce the variance of the gradient estimation, a baseline  $b_{\rho}$  can be introduced (Zhao et al., 2012):

$$\nabla_{\rho} J(\rho) \approx \frac{1}{N} \sum_{n=1}^N (r(h^{(n)}) - b_{\rho}) \nabla_{\rho} \log \mathbb{P}(\theta^{(n)} | \rho).$$

#### 4. POLICY PARAMETRIZATION VIA PARTICLES

To the best of the authors' knowledge, the PGPE method has only been applied to policy parametrizations that are linear in the parameters:  $\pi_{\theta}(x) = \phi(x)^T \theta$ , where  $\theta$  are drawn from a multivariate Gaussian distribution. Such parametrizations have been shown to be effective in high dimensional continuous problems. However, they are not directly applicable in the case when the action space is a finite discrete set. In this section, we present a new parametrization of a policy with discrete actions, and we incorporate the parametrization into the PGPE framework. The idea behind the adopted parametrization is inspired by clustering. We use *particles* labeled with actions to identify the regions of the state space  $X$  that are mapped to different control actions. More precisely, a particle is a point in the state space  $X$  with a label in  $U$ , and the policy deterministically associates to  $x \in X$  the action defined by the label of the particle that is closest to  $x$ . By increasing the number of particles, one can in principle reproduce the map associated with the optimal policy with arbitrary accuracy.

More formally,  $\pi_{\theta}$  is a deterministic policy described by a set of  $p$  labeled particles  $\theta = \{\theta^{(i)}\}_{i=1}^p$  where each particle  $\theta^{(i)} = [x^{(i)}, u^{(i)}]^T$  belongs to the joint space  $X \times U^2$ . Given  $x \in X$ , the action  $u$  associated to  $x$  by policy  $\pi_{\theta}$  is obtained via the  $k$ -NN ( $k$ -nearest neighbors) algorithm with  $k$  equal to 1:

$$\pi_{\theta}(x) = \{u^{(i)} | \Delta(x, x^{(i)}) \leq \Delta(x, x^{(j)}), \forall j \neq i\},$$

where  $\Delta(x, x^{(i)})$  is the Euclidean distance between state  $x$  and the state component  $x^{(i)}$  of the  $i$ -th particle. As a result, the state space is partitioned in polyhedral sets as shown in Figure 1.

A basic strategy consists in selecting a sufficiently high number of particles, each one with an associated *fixed* action, and learn the optimal position of each particle. However, this approach can be very inefficient in complex problems where the number of particles required by each action may be different and *a priori* unknown. A better approach, that overcomes this "preallocation" problem, is to exploit a learning process both for positioning the particle over the state space and determining the associated action.

According to the PGPE scheme, the policy parameters are drawn from some joint distribution  $\mathbb{P}(\theta | \rho)$ . The  $p$  particles  $\theta^{(i)}$  are independent, and each one has an independent distribution over the state and action components, that is  $x^{(i)} \sim \mathcal{N}(\cdot; \mu^{(i)}, \Sigma^{(i)})$  and  $u^{(i)} \sim \mathcal{B}(\cdot; \alpha^{(i)})$ , where:

$$\mathcal{B}(u_l; \alpha^{(i)}) = \frac{e^{\alpha_l^{(i)}}}{\sum_{j=1}^m e^{\alpha_j^{(i)}}},$$

is a Boltzmann distribution ( $u_l$  denotes the  $l$ -th action in  $U$ ). The hyperparameter vector  $\rho$  is then defined as follows:  $\rho = [\mu^{(i)}, \Sigma^{(i)}, \alpha^{(i)}]_{i=1}^p$ .

A graphical representation of the hyperparameters distribution  $\mathbb{P}(\theta | \rho)$  is given in Figure 1, together with a policy

<sup>2</sup> From now on, superscript  $(i)$  denotes the  $i$ -th particle.

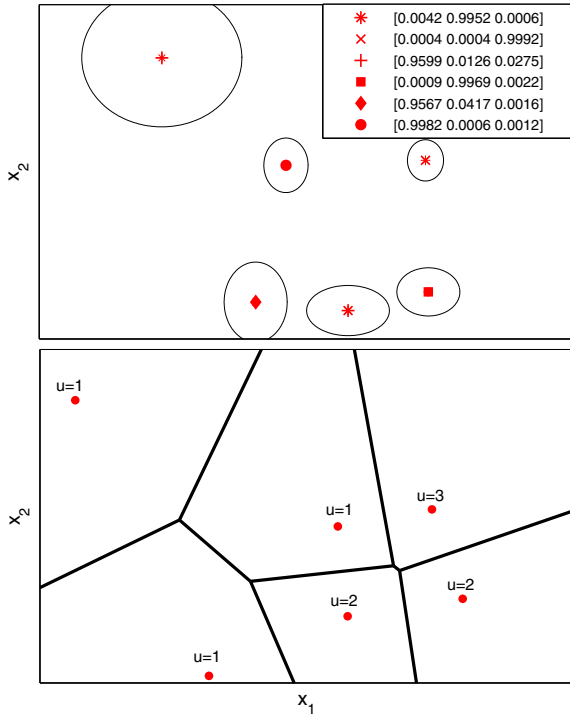

Fig. 1. Illustrative picture of a policy parametrization and of an extracted policy in a two dimensional state space ( $X \subseteq \mathbb{R}^2$ ) with 3 actions ( $|U| = 3$ ). Top: Gaussian distributions of 6 particles (the red symbols and the ellipses represent the mean values and the standard deviation isocurve, respectively), with the associated action probabilities. Bottom: Voronoi diagram of a deterministic policy extracted from the distributions of the particles.

with parameters extracted from  $\mathbb{P}(\theta|\rho)$ .

In order to reduce the number of parameters, we discard the cross-correlation terms in the covariance matrix, so that  $\Sigma^{(i)} = \text{diag}(\Sigma_{11}^{(i)}, \Sigma_{22}^{(i)}, \dots, \Sigma_{nn}^{(i)})$ . Moreover, in order to prevent the variance from becoming negative we exploit the parametrization presented by Kimura and Kobayashi (1998), where  $\Sigma_{jj}^{(i)}$  is represented by a logistic function parameterized by  $\sigma_j^{(i)}$ :  $\Sigma_{jj}^{(i)} = \frac{\tau}{1 + e^{-\sigma_j^{(i)}}}$ .

The total number of hyperparameters is then  $2n \cdot m \cdot p$ , where  $n$  is the dimension of the state space  $X$ ,  $m$  is the number of actions in  $U$ , and  $p$  is the number of particles. The partial derivatives of  $\log \mathbb{P}(\theta|\rho)$  with respect to  $\mu^{(i)}$ ,  $\Sigma^{(i)}$  and  $\alpha^{(i)}$  are given by:

$$\begin{aligned} \nabla_{\mu^{(i)}} \log \mathbb{P}(\theta^{(j)}|\rho) &= \delta_{ij} (\Sigma^{(j)})^{-1} (x^{(j)} - \mu^{(j)}) \\ \nabla_{\sigma_i^{(i)}} \log \mathbb{P}(\theta^{(j)}|\rho) &= \delta_{ij} \frac{e^{-\sigma_i^{(i)}}}{2(1 + e^{-\sigma_i^{(i)}})} \\ &\quad \times \left[ (x^{(j)} - \mu^{(j)})_i^2 (\Sigma_u^{(j)})^{-1} - 1 \right] \\ \nabla_{\alpha_i^{(i)}} \log \mathbb{P}(\theta^{(j)}|\rho) &= \tau \delta_{ij} \left( \delta_{u^{(j)} u_i} - \mathcal{B}(u_i; \alpha^{(j)}) \right), \end{aligned}$$

where  $\delta_{ij} = 1$  when  $i = j$ , and 0 otherwise.

## 5. SIMULATION EXAMPLE

We next present the results of a computational study for the multi-room heating benchmark described by Fehnker and Ivančić (2004), and addressed also in (Abate et al.,

2007, 2008; Prandini and Piroddi, 2012). The problem concerns the simultaneous temperature regulation in  $n$  rooms, assuming that each room has a heater, but that at most one heater at a time can be active. A switching control strategy must be designed that decides at each time step which room should be heated, depending on the temperature values in all the rooms. If the temperature of one or more rooms exits the prescribed range, the control strategy should automatically recover the desired condition in the shortest time possible. A nice feature of this benchmark is that it is suitable for testing the scalability of the proposed policy gradient approach, since the problem dimensionality can be easily increased by adding more rooms.

### 5.1 Model of the multi-room heating system

The multi-room heating system can be modeled as a stochastic hybrid system with hybrid state  $s = (q, x)$ , where the discrete state component  $q$  identifies the actual room being heated, while the continuous state  $x = (x_1, \dots, x_n) \in X = \mathbb{R}^n$  represents the (average) temperature in each room. Accordingly, the discrete state space is defined as  $\mathcal{Q} = \{1, \dots, n+1\}$ , where in mode  $q = i$ ,  $i = 1, \dots, n$ , the  $i$ -th room is heated, while no room is heated when  $q = n+1$ . The control space is given by  $U = \{1, \dots, n+1\}$ , where  $u = i$ ,  $i = 1, \dots, n$ , corresponds to the command of heating the  $i$ -th room, while  $u = n+1$  is the command to switch the heater off. The average temperature in room  $i$  is ruled by the following stochastic difference equation, obtained by Euler discretization of the corresponding continuous time dynamics with constant time step  $\Delta t$ :

$$\begin{aligned} x_i(k+1) &= x_i(k) + b_i(x_a - x_i(k))\Delta t + c_i h_i(k)\Delta t \\ &\quad + \sum_{j=1, \dots, n; j \neq i} a_{ij} (x_j(k) - x_i(k))\Delta t + n_i(k), \quad i = 1, \dots, n, \end{aligned} \quad (1)$$

where  $x_i(k)$  is the average temperature in room  $i$  at time  $k$ ,  $x_a$  is the ambient temperature (assumed constant), and  $h_i(k)$  is a boolean function equal to 1 if  $q(k) = i$  (i.e., when room  $i$  is heated), and 0 otherwise. Parameters  $a_{ij}$ ,  $b_i$  and  $c_i$  in (1) are non-negative constants representing the heat exchange coefficients between room  $i$  and room  $j$  ( $a_{ij}$ ), the heat loss rate of room  $i$  to the ambient ( $b_i$ ) and the heat rate supplied by the heater in room  $i$  ( $c_i$ ), all normalized with respect to the average thermal capacity of room  $i$ . Finally, the disturbance  $n_i(k)$  affecting the temperature of room  $i$  is assumed to be a sequence of i.i.d. Gaussian random variables with zero mean and variance  $\nu^2 \Delta t$ , independent of  $n_j(k)$ ,  $j \neq i$ .

The heaters are controlled by a thermostat that is prone to delay and switching failures. This is modeled through a discrete transition probability function that governs the mode transitions:

$$f_u(q'|q, u) = \begin{cases} 1, & u = q = q' \\ 1 - \alpha, & u \neq q, q' = q \\ \alpha, & u = q', q' \neq q \end{cases}, \quad (2)$$

where  $\alpha \in [0, 1]$  is the one-step delay/failure probability. The desired operating region is given by

$$A = \{(x_1, \dots, x_n) : x_i \in [x_l, x_u], i = 1, \dots, n\},$$

where  $x_l$  and  $x_u$  specify the lower and upper bounds for the temperature in each room.

### 5.2 Control strategy

In order to design the switching control strategy for the multi-room heating system we adopt the self-recovery approach proposed by Prandini and Piroddi (2012) where the objective is to keep the state of the system within  $A$  and drive it back to  $A$  as soon as possible in case of exit. The control design problem can be formulated as in Section 2, where the heater is off in the initial state and the reward function  $r : X \times X \rightarrow \{0, \pm 1, \pm 2, \dots, \pm n\}$  is defined as:

$$r(x, x') = g(x') - g(x)$$

where  $g(x) = \sum_{i=1}^n \mathbf{1}_{[x_l, x_u]}(x_i)$  is the number of rooms whose temperature is within the desired range  $[x_l, x_u]$ . This means that transitions leading the temperature of one room outside  $[x_l, x_u]$  are penalized with  $-1$ , transitions leading the temperature of one room back into  $[x_l, x_u]$  are rewarded with  $+1$ , whereas all other transitions do not provide neither a penalty nor a reward. The discount factor  $\gamma$  re-scales penalties and rewards with time, encouraging early entrances in and late exits from  $A$ , and overall reducing the duration of periods outside  $A$  (Prandini and Piroddi, 2012).

### 5.3 Numerical results

The proposed approach has been tested for the  $n$ -room case with  $n = 1, \dots, 5$  with two different objectives. First, a *safety problem* has been addressed, optimizing the control policy starting from the interior of the safe zone  $A$  (all rooms are initially at  $19^\circ\text{C}$ ), with the objective of remaining inside set  $A$  as much as possible. Then, a *recovery problem* has been solved, where the starting point of the optimization procedure is placed outside  $A$  (all rooms are initially at  $17^\circ\text{C}$ ), with the objective of reaching the safe set  $A$  as soon as possible, and remaining inside thereof. The following parameters have been employed in the experiments:  $\Delta t = 1/30$ ,  $\nu = 1$ ,  $x_a = 6$ ,  $b_i = 0.25$  and  $c_i = 12$  for  $i = 1, \dots, 5$ ,  $a_{ij} = a_{ji} = 0.33$ , for  $i = 1, \dots, 4$  with  $j = i + 1$ ,  $\alpha = 0.8$ . As for the safe temperature range, we chose  $[x_l, x_u] = [17.5, 22]$ . A discount factor  $\gamma = 0.999$  was used in the calculation of the total reward. The time horizon length has been set to  $T = 100$ . The learning rates are set equal to the variance for the Gaussian parameters and to 1 for the Boltzmann parameters.

The same problem with  $n \leq 3$  has been addressed in (Prandini and Piroddi, 2012) based on an ADP scheme with continuous state gridding. Based on those results, where very similar policies resulted for different values of the discrete mode, the latter has not been considered in the policy parametrization (which depends only on the continuous state components), although it enters the dynamics of the system.

To illustrate the results we first make reference to the 2-room case. The PGPE algorithm has been applied using 3 particles only (each associated to a specific control action). Given the simplicity of the underlying control problem, increasing the number of particles has not provided significant improvements. The mean values of the particles have been initialized randomly, while the initial variance has been set to 9. A maximum of 250 iterations was allowed to achieve convergence, which is ascertained through a condition of the type  $\|\nabla_{\rho} J(\rho)\| < \epsilon$ , where

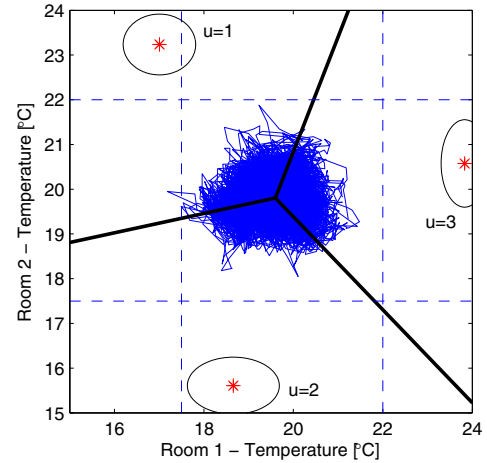

Fig. 2. Safety problem. The Voronoi diagram defining the policy associated to the learned parameter vector  $\rho$  is depicted considering the mean position  $\mu^{(i)}$  of particles. The ellipses represent the isolevel curves associated to the standard deviations of the Gaussian distributions of the particles. The labels represent the deterministic actions  $u^{(i)}$ . 200 trajectories obtained following the mentioned policy starting from  $x(0) = [19 \ 19]^T$  are reported (blue lines).

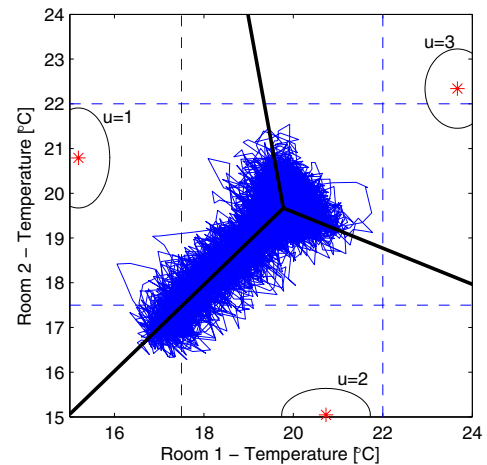

Fig. 3. Recovery problem. Optimal policy parametrization and 200 trajectories starting from  $x(0) = [17 \ 17]^T$ .

$\epsilon = 0.001$  is a suitably small threshold (typically, for the 2-room case convergence is achieved much earlier than the allotted iterations). At each iteration the gradient is evaluated based on 1000 deterministic policies drawn from the current hyperparameters distribution. Each policy is evaluated on a sample trajectory of length 100. Figure 2 reports the hyperparameters of the policy distribution and the deterministic policy corresponding to the mean values of the particles. The figure also shows 200 trajectories starting from  $x(0) = [19 \ 19]^T$ . All trajectories remain inside  $A$  on average 99.99% of the time (only two isolated samples are outside  $A$ ). The policy has been further validated testing different initial conditions drawn uniformly inside  $A$ , resulting in a 99.77% permanence inside  $A$  on average.

The recovery problem has been also addressed with reference to the 2-room case. Figure 3 illustrates the hyperparameters, the mean policy and a set of trajectories starting from  $x(0) = [17 \ 17]^T$ . This second problem results in a

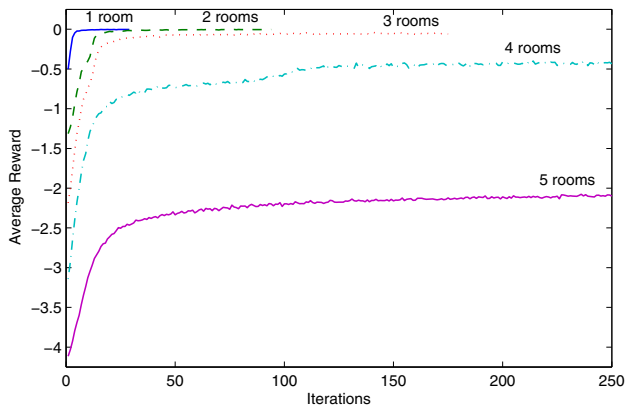

Fig. 4. Safety problem ( $n = 1, \dots, 5$ ): reward evolution as a function of the algorithm iterations.

Table 1. Computational results for the safety problem: PGPE algorithm.

Number of rooms	Particles	Iterations	CPU time [s]	Memory [kB]
1	2	29	362	6
2	3	94	1000	33
3	4	175	1500	70
4	5	250	1780	116
5	6	250	1788	162

Table 2. Computational results for the safety problem: gridding approach.

Number of rooms	Bins	Iterations	CPU time [s]	Memory [kB]
1	30	44	0	20
2	30	36	100	3800
3	30	69	8836	$10^6$

wider exploration of the state space, and not surprisingly the resulting policy is much more similar to the optimal one according to Prandini and Piroddi (2012). All trajectories of the tested policy terminate inside  $A$ . This requires 8.19 steps on average.

Both the safety and recovery problems have been applied to larger case instances, up to 5 rooms. In each case  $|U| = n + 1$  particles have been employed only, each associated to a specific action, and the same iteration limit and number of policy extractions have been considered. The policy evaluation cost increases linearly with the state vector dimension. Due to the augmented complexity of the optimization problem (the parameter space is larger), a longer time is typically required to achieve convergence (see, e.g., Figure 4). Notice that while the optimal expected reward value ( $J(\rho^*) = 0$ ) is achieved for the low dimensional problems, lower rewards are obtained for  $n = 4, 5$ . This is justified by the under-actuated nature of the problem (only one room at a time can be heated). Finally, Table 1 reports some figures regarding the computational load of the approach. Both the average computational time and the memory occupancy are included. Notice that for the proposed approach the CPU time and the memory occupancy increase linearly with the problem dimension (the number of particles is chosen equal to  $n + 1$ ), as opposed to the previously developed ADP approach based on gridding which scales unfavorably with the state dimension (see Table 2, where the state is gridded uniformly using 30 bins per dimension).

## 6. CONCLUSIONS

This paper has investigated a policy search technique that applies to stochastic systems with continuous state and discrete action spaces, and appears to scale favorably with state space size. The presented approach is based on the PGPE policy-gradient technique, endowed with a novel policy parametrization using particles to describe entire areas of the state space associated to the same action. By encapsulating the policy parametrization in the PGPE framework, it is possible to automatically learn both the position of the particle in the state space and the associated action. This ability comes at the price of a high number of parameters to be tuned, that scales proportionally to the number of particles. However, the number of samples required by the algorithm in order to estimate the gradient direction is not strictly related to the number of parameters (i.e., particles) and does not increase exponentially with the state dimension.
